

Class 1 Assignment: Your Context Moat

The gap between what you know and what Claude knows is the one thing AI cannot copy. This week you prove you can use it. Time: about 30 minutes. This is the warm-up; the work gets meatier from here.

What you walk away with

A one-page **Context Moat** write-up: a before/after showing the same brief producing generic output without your context and sharp output with it, plus a short statement of what you know that Claude structurally cannot.

- **Standalone value:** a LinkedIn-ready insight and proof you can wield context. Useful even if you do nothing else in the course.
 - **How it stacks:** it becomes the opening framing ("the problem and what I knew that the model didn't") of your EduBridge case study in Class 7.
-

The task

1. Pick a real brief: your own last project brief works best, because your context moat is about a client, user, and market you actually know. (No project of your own? Any brief you have seen at work is fine.)
 2. Open Claude. Paste the brief with **no** extra context. Save the output.
 3. Paste the same brief again, this time with a context block first (who the users are, their devices, their constraints, what the client actually cares about). Use the BD context block from the Class 1 resources as your model.
 4. In 4 to 6 bullets, name what changed between the two outputs and **why** it matters.
 5. Write your Context Moat in one paragraph: what do YOU know about this user, market, or client that Claude could never know unless you told it? That sentence is your job security. Write it down.
-

What good looks like

- The two outputs are genuinely different, and you can point to specific lines that changed because of context (not a vague "it got better").
- Your "what changed" bullets name the mechanism (for example, "it stopped assuming desktop because I told it sub-15K taka Android"), not vibes.

- Your context-moat paragraph names something concrete and personal (a client history, a local behavior, a device reality), not a generic "I understand users."
 - It reads like something you would be comfortable posting in public.
-

Before you submit (self-check)

- Both outputs saved (screenshot or pasted text).
 - 4 to 6 "what changed" bullets, each tied to a specific context line.
 - One context-moat paragraph, concrete and in your own voice.
 - No AI-slop phrasing: no "in today's fast-paced world," no empty superlatives.
-

What to submit

One page (doc, PDF, or a post) with the two outputs, your bullets, and your moat paragraph. Post it in the class channel before Class 2. If you are comfortable, post the moat paragraph publicly on LinkedIn and tag it as week 1 of the course.

Fell behind, or short on time this week?

This one stands alone, so do it whenever you can. From Class 2 you carry the EduBridge project (clone the course repo this week so it is ready). For now, any real brief of yours works. The minimum that still counts: the two outputs plus your one moat paragraph.
